

10 PROJECTS · CLAUDE CONNECTORS

10 connector projects.

Small, buildable projects using Claude's connectors — each finished in a single working session. Prerequisites, steps, and the exact prompt to copy.

10 projects

copy-paste prompts

one session each

QUICK REFERENCE

Pick one project. Build it end to end.

Choose by what you will actually use and the connectors you already have. Difficulty rates setup effort, not the value of the project.

#	PROJECT	CONNECTOR	DIFFICULTY	TIME
01	Weekly Status Deck		Beginner	15 min
02	Second-Brain Inbox Router		Beginner	30 min setup, 2 min daily
03	Meeting → Action Items Pipeline		Intermediate	20 min setup, runs per meeting
04	Personal Finance Dashboard		Intermediate	45 min build, 30 sec per entry
05	Article → Audio Companion		Beginner	20 min setup, 5 min per article
06	Design System Audit		Beginner	15 min per audit
07	Quote-to-Carousel Generator		Intermediate	30 min setup, 3 min per carousel
08	Workshop Board Generator		Intermediate	20 min per workshop
09	Goal Decomposer		Beginner	10 min per goal
10	Content Distribution Workflow		Advanced	2–3 hours setup, then automatic

Easiest first wins: projects 1, 6 and 9 return visible output in under 15 minutes.
Highest ongoing leverage: 2 and 3, saving time every week.

PROJECT 01

Weekly Status Deck

Beginner

15 min

Takes your raw weekly status notes — bullets, scratch, half-written thoughts — and produces a polished 5-slide Gamma deck ready to share with your team or manager. Replaces the 30 minutes you'd spend formatting a status update with 30 seconds of paste-and-go.

PREREQUISITES

- Enable the Gamma connector in Claude (Settings → Connectors)
- A free Gamma account (gamma.app)
- 5 minutes of raw weekly notes to test it on

BUILD STEPS

- 01** Enable the Gamma connector in Claude's settings
- 02** At the end of your week, dump your wins, blockers, and progress as bullets — no formatting needed
- 03** Paste the prompt below into Claude with your notes filled in
- 04** Claude generates the deck in Gamma and returns a link
- 05** Open in Gamma, polish 1–2 slides, share with your team

THE PROMPT • PROJECT 01

Weekly Status Deck

Generate a weekly status deck in Gamma with 5 slides.

Week of: [DATE]

Team / project: [NAME]

Audience: [MANAGER / TEAM / EXEC]

My raw week's work:

[PASTE BULLETS]

Slide structure:

1. Title slide — week, team, headline outcome in one line
2. Wins — top 3 accomplishments with measurable outcomes
3. In progress — what's mid-flight with % complete and ETA
4. Blockers & risks — what's at risk, what's needed to unblock
5. Next week + asks — top 3 priorities, specific asks from the audience

Rules:

- Slide titles must be assertions, not topics
("Shipped onboarding flow, conversion up 18%" not "Onboarding update")
- Each slide max 4 bullets, each bullet under 12 words
- Use Gamma's clean professional theme
- Add speaker notes only on slides 2 and 4

After generating, share the link.

Enhancement when ready. Save the prompt as a Notion template page so you can run it weekly with one click.

PROJECT 02

Second-Brain Inbox Router

Beginner

30 min setup, 2 min daily

One Notion Inbox database where you dump anything throughout the day — ideas, tasks, links, journal thoughts. Claude reads the inbox once daily, classifies each entry, tags it, and moves it to the right destination database. Replaces the “my notes are everywhere” problem with a single capture point.

PREREQUISITES

- Notion connector enabled (you already have this)
- Create 5 databases in Notion: Inbox, Tasks, Ideas, Reference, Journal
- Inbox needs properties: Content (text), Created (date), Status (Unprocessed / Processed)
- Each destination database needs: Title, Content, Tags (multi-select), Source

BUILD STEPS

- 01** Create the 5 databases in Notion with the properties above
- 02** Bookmark the Inbox page so you can capture quickly from anywhere
- 03** During the day, dump anything into Inbox — no formatting, just text
- 04** Once a day, send the prompt below to Claude
- 05** Claude processes the unprocessed entries and shows a summary of what moved where

THE PROMPT • PROJECT 02

Second-Brain Inbox Router

Read my Notion Inbox database. For each entry where Status = "Unprocessed":

1. Classify it as one of: Task / Idea / Reference / Journal
 - Task: anything actionable with a verb
 - Idea: a thought or concept worth keeping but not actionable yet
 - Reference: a link, fact, or saved info I'll want to look up later
 - Journal: a reflection, feeling, or observation about my day
2. Generate 2-3 relevant tags based on the content
3. Create a new entry in the appropriate destination database with:
 - Title (extracted or generated from the content)
 - Content (the original text)
 - Tags
 - Source = Inbox
 - Created date = the original entry's date
4. Mark the original Inbox entry as Status = "Processed"

If any entry is too vague or ambiguous to classify, skip it and flag it at the end so I can clarify.

Show me a summary table: how many entries moved to each destination, plus the flagged-for-review list.

Enhancement when ready. Add a weekly review prompt that surfaces patterns in what came through the inbox over the last 7 days.

PROJECT 03

Meeting → Action Items Pipeline

Intermediate

20 min setup, runs per meeting

After a Granola meeting, Claude pulls the transcript, extracts decisions and action items, identifies owners, creates Notion tasks, and drafts the follow-up email to attendees. The connector chain does the boring post-meeting work so you can focus on the next conversation.

PREREQUISITES

- Granola connector enabled
- Notion connector enabled
- A Tasks database in Notion with: Title, Owner, Due Date, Project, Priority, Status, Source
- Granola actively recording your meetings

BUILD STEPS

- 01** Enable both Granola and Notion connectors
- 02** Verify your Notion Tasks database has the required properties
- 03** After a meeting, send the prompt below to Claude
- 04** Claude pulls the most recent Granola transcript automatically
- 05** Review the extracted actions before they go to Notion (Claude will show them first)
- 06** Confirm, then Claude creates tasks and drafts the email

THE PROMPT • PROJECT 03

Meeting → Action Items Pipeline

Read my most recent Granola meeting transcript.

Extract:

1. Key decisions made (with rationale if mentioned in the discussion)
2. Action items — for each: action, owner, due date (infer from context if not stated), priority (P1/P2/P3)
3. Open questions / parking lot items

Project context: **[PROJECT NAME]**

Before creating anything in Notion, show me the extracted list so I can confirm or correct.

Once I confirm, push every action item to my Notion "Tasks" database with:

- Title = the action (rewritten as a verb-first task)
- Owner = the named person
- Due Date = mentioned or inferred (flag if guessed)
- Project = **[PROJECT NAME]**
- Priority = your assessment
- Status = Not started
- Source = link to the Granola meeting

After creating tasks, draft a follow-up email to attendees with:

- 3-bullet recap (decisions + key discussion)
- Action items table (owner, action, deadline)

Enhancement when ready. Trigger this automatically via Granola's meeting-end webhook → n8n → Claude so it runs without you asking.

PROJECT 04

Personal Finance Dashboard

Intermediate

45 min build, 30 sec per entry

A no-code expense tracker app in Base44 where you log expenses by typing naturally (“\$42 lunch with Sam, work client meeting”). Claude parses each entry, categorizes it, tags work vs. personal, and surfaces weekly summaries. Lightweight alternative to YNAB or Mint that you fully own.

PREREQUISITES

- Base44 account (base44.com — has a free tier)
- Claude API access (Base44 supports calling Claude directly)
- 30 minutes to build the app structure in Base44

BUILD STEPS

- 01** In Base44, create a new app called “Expenses”
- 02** Create a table named “Expenses” with columns: Date, Amount, Description, Category (dropdown), Tag (Work/Personal/Mixed), Needs Reimbursement (checkbox)
- 03** Add a single text field on the home screen labeled “Quick Entry”
- 04** Connect the Quick Entry field to Claude via Base44’s AI action — use the prompt below as the system prompt
- 05** Map Claude’s JSON output to your table columns
- 06** Build 3 views: Weekly Summary, By Category, Work Reimbursable
- 07** Add one chart: spending by category for the current month

THE PROMPT • PROJECT 04

Personal Finance Dashboard

Parse this expense entry into structured data.

Input: **[USER'S NATURAL LANGUAGE ENTRY]**

Example inputs:

- "42 lunch with Sam, client meeting" → Food / Work
- "Uber to airport 65" → Transport / Work
- "Coffee 6" → Food / Personal

Output ONLY valid JSON in this exact shape:

```
{
  "amount": <number>,
  "description": "<short description, max 60 chars>",
  "category": "<one of: Food, Transport, Software, Office,
Travel, Entertainment, Health, Other>",
  "tag": "<Work / Personal / Mixed>",
  "needs_reimbursement": <true or false>,
  "confidence": "<high / medium / low>"
}
```

Rules:

- If amount is unclear, return confidence: "low" and amount: null
- If entry mentions client, customer, or work context, default to Work tag

Enhancement when ready. Add a weekly Sunday-night summary email Claude generates: spending vs. budget, biggest categories, anomalies, and reimbursables to file.

PROJECT 05

Article → Audio Companion

Beginner

20 min setup, 5 min per article

Convert long articles, your own Notion drafts, or saved Pocket items into audio you can listen to during commutes. Claude cleans the text for spoken delivery (removes navigation cruft, expands abbreviations, adds natural pauses), then ElevenLabs generates the audio in your chosen voice.

PREREQUISITES

- ElevenLabs account (free tier gives ~10 min/month, paid plans start at \$5/mo)
- ElevenLabs connector enabled in Claude
- Choose or clone a voice in ElevenLabs and note its voice ID

BUILD STEPS

- 01** Sign up at elevenlabs.io and pick a voice (try “Rachel” or “Adam” as starting options)
- 02** Copy the voice ID from your ElevenLabs library
- 03** Enable the ElevenLabs connector in Claude
- 04** Paste the article text or share a URL with Claude using the prompt below
- 05** Review Claude's cleaned transcript before audio generation
- 06** Approve and Claude sends to ElevenLabs; you get an audio file back

THE PROMPT • PROJECT 05

Article → Audio Companion

Convert this article into an audio-ready transcript, then generate audio via ElevenLabs.

Source:

[PASTE ARTICLE TEXT OR URL]

Voice ID: **[YOUR ELEVENLABS VOICE ID]**

Target length: **[KEEP FULL / TRIM TO 10 MIN / SUMMARIZE]**

Pre-processing rules — before sending to ElevenLabs:

1. Remove navigation cruft, ads, social share prompts, author bio boxes
2. Expand abbreviations on first mention (e.g., "API" → "API, application programming interface")
3. Add natural pauses with commas and ellipses where prose feels rushed
4. Convert numerals to words where it reads better spoken ("2024" → "twenty twenty-four", "\$42" → "forty-two dollars")
5. Replace visual references with spoken-friendly versions ("as you can see below" → "as I'll describe next")
6. Spell out or skip URLs and code snippets — say "see the show notes"
7. Break up sentences over 30 words into shorter ones

Show me the cleaned transcript first for approval. After I confirm, generate the audio file via ElevenLabs and share the download link.

Enhancement when ready. Hook this into Pocket or Readwise so saved articles get an automatic audio version every morning.

PROJECT 06

Design System Audit

Beginner

15 min per audit

Point Claude at a Figma file and get back a prioritized cleanup checklist: detached instances, off-brand colors, inconsistent component naming, layers named “Frame 234.” Saves a design lead an hour of clicking through frames manually.

PREREQUISITES

- Figma connector enabled (you already have this)
- Read access to the Figma file you want audited
- Your brand guidelines documented (colors, fonts, naming conventions)

BUILD STEPS

- 01** Open the Figma file you want to audit
- 02** Copy the file URL
- 03** Send the prompt below with your brand info filled in
- 04** Claude scans the file and returns a prioritized checklist
- 05** Work through the checklist in Figma, top to bottom
- 06** Re-run monthly as a recurring design system health check

THE PROMPT • PROJECT 06

Design System Audit

Audit this Figma file for design system hygiene.

File URL: **[PASTE]**

Brand guidelines:

- Primary colors (hex): **[LIST]**
- Secondary colors: **[LIST]**
- Approved fonts: **[LIST]**
- Component naming convention: **[E.G., "Component/Variant/State"]**

Check for:

1. Detached instances — components broken from their source library
2. Off-brand colors — any fill, stroke, or shadow not in the brand palette
3. Font violations — text using fonts outside the approved list
4. Inconsistent component naming — components not following the convention
5. Auto-generic layers — anything still named "Frame 234," "Rectangle 16"
6. Duplicate components — visually identical components that should be merged
7. Missing variants — buttons / inputs / cards lacking common states
8. Orphan components — used only once or zero times
9. Text style violations — text not using a defined text style

Output a prioritized table:

| Severity | Frame / Component | Issue | Specific fix |

Severity scale:

- Blocker: actively breaks consistency or causes design debt
- Major: shipping risk if used in production
- Minor: cleanup that improves maintainability

Enhancement when ready. Schedule the audit to run monthly and post the results to a Slack design channel automatically.

PROJECT 07

Quote-to-Carousel Generator

Intermediate

30 min setup, 3 min per carousel

Take any long-form input – a blog post, your LinkedIn write-up, a transcript – and turn it into a 6–8 slide Canva carousel. Claude extracts the best quotes, sequences them as a narrative, and fills your branded Canva template. The fastest content-leverage win available.

PREREQUISITES

- Canva account (free tier works, Pro helps with brand kit)
- Canva connector enabled in Claude
- A master carousel template saved in Canva with your brand fonts and colors
- 1080×1080 dimensions, 6–8 slides, with text placeholders named consistently

BUILD STEPS

- 01** In Canva, build a master carousel template – keep the layout simple and on-brand
- 02** Name your text layers consistently (e.g., “headline,” “subtext,” “slide_num”)
- 03** Enable the Canva connector
- 04** Paste your long-form content with the prompt below
- 05** Claude extracts quotes and sequences them, then pushes to Canva using your template
- 06** Open in Canva for a final review before exporting

THE PROMPT • PROJECT 07

Quote-to-Carousel Generator

Generate a LinkedIn carousel in Canva from this long-form content.

Source content:

[PASTE FULL TEXT]

Template name: **[YOUR CANVA TEMPLATE NAME]**

Audience: **[WHO IT'S FOR]**

Tone: **[PROFESSIONAL / CONVERSATIONAL / PUNCHY]**

Carousel structure (6-8 slides total):

- Slide 1: HOOK — the single most attention-grabbing line. Should make a scroller stop.
- Slides 2 through (N-1): ONE key insight per slide. Each must stand alone if someone only sees that slide.
- Final slide: CTA — read full post / follow for more / save this

Per-slide spec:

- Headline: max 10 words, sharp and assertive
- Subtext: max 25 words, supporting the headline
- Slide indicator: "X / N"

Hard rules:

- No slide contains more than 30 words total
- No slide depends on the previous slide for context
- Sequence should feel like a payoff — by slide 5 reader thinks "saving this"

Enhancement when ready. Build a Notion database of source posts → generated carousels so you can track which formats perform best.

PROJECT 08

Workshop Board Generator

Intermediate

20 min per workshop

Before any workshop you facilitate, tell Claude the goal and the format. It builds a pre-populated Miro board — frames, sticky-note prompts, voting dots, timer markers, facilitator notes — so you walk in ready instead of spending 45 minutes pre-building.

PREREQUISITES

- Miro account (free tier allows 3 boards)
- Miro connector enabled
- Optional: a few reusable workshop frame templates in your Miro team library

BUILD STEPS

- 01** Enable the Miro connector in Claude
- 02** Before your workshop, share the goal, format, and attendee count with Claude
- 03** Send the prompt below filled in with your details
- 04** Claude builds the board structure in your Miro workspace
- 05** Open the board in Miro and tweak the prompts or styling
- 06** Share the board link with attendees 24 hours before

THE PROMPT • PROJECT 08

Workshop Board Generator

Build a Miro board for this workshop.

Workshop goal: [WHAT YOU WANT TO ACHIEVE BY THE END]

Workshop type: [BRAINSTORM / RETRO / PRIORITIZATION / DECISION-MAKING / KICKOFF]

Duration: [TOTAL MINUTES]

Attendees: [NUMBER + ROLES]

Format: [IN-PERSON / REMOTE / HYBRID]

Pre-work I want them to do: [IF ANY]

Build a board with these frames in left-to-right order:

1. Welcome frame — goal, agenda with time allocations, working agreements
2. Context frame — pre-populated stickies with inputs attendees should know
3. Divergence frame — empty sticky grid for individual brainstorming
4. Convergence frame — clustering area with column headers prepared
5. Voting frame — top candidates placeholder with vote-dot legend
6. Synthesis frame — action items, owners, next steps with a template row

Per-frame additions:

- Timer sticky in the top-right showing minutes allocated
- Facilitator notes (small grey text) on what to do at this stage
- Color coding: yellow = participant input, blue = context, pink = actions

After building, share the board link and a 5-line facilitator cheat sheet

I can keep open in another tab.

Enhancement when ready. Save a few workshop archetypes (sprint retro, opportunity mapping, postmortem) as named recipes Claude can recall by name.

PROJECT 09

Goal Decomposer

Beginner

10 min per goal

Tell Claude a quarterly goal in one sentence. It breaks the goal into 3 monthly milestones, then into weekly themes, then into specific daily tasks – and creates them all in the right Todoist project with realistic effort estimates and labels. The hard part of personal productivity is decomposition, not capture; this targets the actual bottleneck.

PREREQUISITES

- Todoist account (free tier works for most cases)
- Todoist connector enabled in Claude

BUILD STEPS

- 01 Enable the Todoist connector
- 02 Write your quarterly goal in one sentence – be specific about the outcome
- 03 Send the prompt below filled in with your goal and constraints
- 04 Claude creates the project, sections, and tasks in Todoist
- 05 Review the first week – adjust task sizing if anything looks too big
- 06 Re-run weekly to re-balance based on what actually got done

THE PROMPT • PROJECT 09

Goal Decomposer

Decompose this quarterly goal into a fully built-out Todoist project.

Goal: **[ONE-SENTENCE QUARTERLY GOAL – be specific about the outcome]**

Quarter: **[Q1 / Q2 / Q3 / Q4 – YEAR]**

Hours per week I can dedicate: **[NUMBER]**

Constraints: **[VACATIONS, BUSY WEEKS, EVENTS, OTHER COMMITMENTS]**

Current state: **[WHERE YOU'RE STARTING FROM]**

Build the project:

1. Create a new Todoist project named "**[Short goal title]**"
2. Add Section: "Monthly milestones" – 3 milestones with due dates
3. Add Section: "Week 1" through "Week 12" – for each week, generate 3-5 specific tasks:
 - Task name starts with a verb ("Draft outline" not "Intro chapter")
 - Due date within that week
 - Priority: P1 (critical), P2 (important), P3 (nice-to-have)
 - Label: @deep-work / @quick-task / @waiting-on-someone / @learning
4. Add Section: "Backlog" – tasks to park unless time opens up

Rules:

- Each task should be doable in 90 minutes or less (split bigger ones)
- Front-load risky work in weeks 1-4 so I can pivot if needed
- Buffer weeks 11-12 for slippage – keep them light
- Flag any week that looks overloaded given my hours/week constraint
- If the goal is too ambitious for the quarter, say so before building

Show me a summary at the end: total tasks, hours estimated, busiest week, biggest risk to completion.

Enhancement when ready. At the end of each week, run a quick check-in prompt that compares planned vs. completed and rebalances the next week.

PROJECT 10

Content Distribution Workflow

Advanced

2–3 hours setup, then automatic

When you publish a blog post (or mark a Notion page as Published), n8n triggers automatically. Claude reads the post, generates a LinkedIn version, Twitter thread, newsletter intro, and short-form video script — and queues each into the right destination. The publish action triggers the entire distribution chain without you copy-pasting.

PREREQUISITES

- n8n account (cloud at n8n.cloud or self-hosted)
- Anthropic API key (Claude API access)
- A source: Notion published page, RSS feed, or webhook
- Destinations: Buffer, Typefully, ConvertKit/Mailchimp, or direct platform APIs
- Basic comfort with n8n's node interface (no code needed)

BUILD STEPS

- 01** Sign up at n8n.cloud (or install self-hosted)
- 02** Build a workflow: Trigger → Read content → Anthropic (Claude) → Parse JSON → 4 destination nodes
- 03** Trigger: pick one — Notion (when status changes to Published), RSS feed update, or webhook
- 04** Read content: pull the full page/post text
- 05** Anthropic node: paste the prompt below, set model to `claude-sonnet-4-6`, `max_tokens 2000`
- 06** Parse JSON: use n8n's Code node to extract each platform variation
- 07** Destination nodes: one each for LinkedIn (via Buffer), Twitter (via Typefully), Email (via

THE PROMPT • PROJECT 10

Content Distribution Workflow

Generate platform-specific content variations from this published post.

Source post:

[PASTE – auto-populated from trigger step]

Original audience: **[DESCRIBE]**

Brand voice: **[DESCRIBE BRIEFLY]**

Output ONLY valid JSON – no prose, no markdown, no explanations:

```
{
  "linkedin_post": {
    "hook": "<opening line, under 15 words>",
    "body": "<full post, under 200 words>",
    "cta": "<question or invitation, under 20 words>"
  },
  "twitter_thread": [
    "<tweet 1, hook, under 280 chars>"
  ]
}
```

Enhancement when ready. Add an analytics loop – track engagement on each platform variation and use that data to refine the prompt over time.

NOTES FOR BUILDING

Connected systems compound the value of each project.

Enable a connector only for the project you're building now. Save each prompt as a living artifact — after two or three runs you'll know what to tweak. Start with one, get it working, then layer the next.
